The first AutoCAD, released in 1982, was a comprehensive CAD system with built-in drafters and designers, which could produce architectural, mechanical, electrical, or architectural design drawings. Since then, AutoCAD has added various components and tools, including: a drawing management system that allowed users to save, open, review, and share drawings on a network, a database that enabled users to store information about parts, dimensions, surfaces, and other properties of drawings, a preprocessor that converted drawings to formats that could be used to print and e-mail them to other CAD systems, a 3D modeler, a command line interface, measurements and other gauges, 2D drafting, a 2D or 3D graphics display engine, scripting, a version control system that allows users to mark drawings as "stored" or "unsaved," and text-based construction tools for creating interactive parts. Today, AutoCAD has evolved to become a comprehensive suite of both software and services. A unified operating system and application architecture enables AutoCAD to provide the most comprehensive suite of integrated tools for 2D and 3D drafting, design, and collaboration. AutoCAD is used to create a variety of two-dimensional (2D) and three-dimensional (3D) designs. Some examples of 2D and 3D designs include: 2D drafting such as creating a rough drawing to explore a design concept, 2D drafting tools such as the block feature, the two-point dimension feature, and the BESIDES context menu, 3D modeling tools, such as B-Rep modeling, the wireframe feature, and the 3D UCS feature, 2D drawing tools, such as B-Rep features, extrusions, and the UCS tool, 2D CAD technology, such as working with a model on the web, making B-Rep models, 3D solids, and surfaces, 3D CAD technology, such as using the modeler to create an engineering model, and 3D CAM technology, such as making plaster molds for CNC machining or making 3D prints for digital manufacturing. The workflow of using AutoCAD involves creating, modifying, and sharing a design. After a drawing is created, users can perform various tasks to modify the design. The

I have a VPS on a Digital Ocean droplet. I would like to setup 2 DNS servers and configure them to serve the subnets that I have on my VPS. I have tried putting both DNS servers on the same machine, with the same IP but it doesn't work. The issue is that they are both serving /etc/resolv.conf on the same subnet. Is there a way to have 2 DNS servers, both on the same machine, but each on a different subnet? A: If you use virtualbox, install virtualbox and set a second vps as a guest. Edit the guest additions and change the networking configuration to bridge to the host with a different IP.
